This disclosure relates generally to techniques for reducing power in a data processing system, and more specifically to providing a timer-based entry and exit to a low-power mode. This section is intended to introduce the reader to various aspects of art that may be related to

---

various aspects of the present techniques, which are described and/or claimed below. This discussion is believed to be helpful in providing the reader with background information to facilitate a better understanding of the various aspects of the present disclosure.

Accordingly, it should be understood that these statements are to be read in this light, and not as admissions of prior art. In many instances, data processing devices that are used in embedded applications may experience power savings as compared to data processing devices

---

used in traditional computers. In some cases, these power savings may be greater than 50%, for example.

However, data processing devices used in embedded applications may have very different requirements than data processing devices used in traditional computers. For example, as compared to data processing devices used in traditional computers, embedded data processing devices may have power-consumption requirements that are relatively low.

As a result, some embedded data processing devices may be configured to enter a low-power mode of

---

operation when the data processing devices are not performing an operation for which a high-power mode of operation is specified. When the embedded data processing devices enter the low-power
