I am wondering what method in .NET can I use to reverse engineer an HTTP message so that I can see what the arguments passed to the web service are, etc. To give more context, the application is a chat application, and when a user wants to create a new chat, they have to provide a chat name, list of chat room names, list of member names in the chat room, a photo for the user, etc. The web service accepts a POST message and returns to the application whether the message was processed successfully. The response message sent from the web service is a HTTP message. Thank you. A: Yes, you should be able to analyze the HTTP headers sent in order to understand what the request actually is and what the response is. You will probably want to turn on trace flags to see the actual HTTP traffic. i n - 1 0 1 8 7 , - 1 0 2 3 0 , - 1 0 3 0 3 , - 1 0 4 1 6 , - 1 0 5 6 9 , - 1 0 7 6 2 ? - 1 1 0 0 5 W h a t c o m e s n e x t : 1 7 3 6 7 7 5 , 1 7 3 6 7
