Expression of peroxisome proliferator-activated receptor (PPAR)gamma coactivator (PGC) proteins has been found to be reduced in the livers of patients with nonalcoholic fatty liver disease (NAFLD). Reduced expression of PGC-1alpha may, at least in part, explain the molecular mechanism of the decreased responsiveness of PPARgamma to its ligands in this disease. In this study, we examined the expression of mRNA for the corepressors, NCoR and SMRT, which are thought to play an important role in the transcriptional regulation of PPARgamma in the livers of patients with NAFLD and control subjects. The mRNA levels of NCoR and SMRT were examined in liver biopsy specimens of patients with NAFLD and control subjects by Northern blotting and in situ hybridization histochemistry. The protein levels of the NCoR and SMRT were examined by Western blotting. The expression levels of mRNA and protein for both NCoR and SMRT were decreased in the livers of patients with NAFLD compared with controls. The protein levels of NCoR and SMRT were also decreased in the livers of patients with NAFLD compared with controls. The mRNA and protein levels of both NCoR and SMRT were correlated with the degree of steatosis and inflammation. The correlation was especially strong between the mRNA level of SMRT and the degree of steatosis. Decreased expression of NCoR and SMRT, and possibly reduced transcriptional activity of PPARgamma in the livers of patients with NAFLD, may contribute to the development of this disease.Q: Let's Vote on Tempting Spoilers! So after doing a lot of voting today and seeing some questions marked as a duplicate of others, I decided to vote on the ones that look like they might be. Most of the questions looked pretty obvious, but I did find one that has a little confusion. "Java: How can I sort an arraylist by multiple values?": I don't see how this question is a duplicate of another one. 2d92ce491b
