Find and Replace Review by Jonathan Clack April 24, 2014 The String Find and Replace is an application that allows users to find and replace strings of text in multiple documents at once. The design of the application is curiously compartmentalized, with the right side containing a search box, find button, and document name list, and a left hand pane containing a preview bar and a button for viewing all documents. These three containers are not interconnected, which leaves the program ill-equipped to properly work if a user wants to make changes to more than one document. The

preview area is compressed, so most of the search results are replaced immediately and replaced with a search string, which doesn't show much detail on what a user needs to see, though the software does let you replace the current text. There is also not a way for users to perform a search, replace, or backup operation on multiple documents at once, which would be helpful when making edits to multiple files. There are a few icons on the far right that you can click to switch between the three tabs. String Find and Replace Pros: Intuitive and compact interface Easy

to install and use Robust function that does work well String Find and Replace Cons: Does not let you perform searches on multiple files at once Compartmentalized interface leaves users in the dark String Find and Replace Verdict: A highly functional software tool that will make most people happy, yet would be at home in a more spacious program In my experience of finding and replacing text in multiple files, String Find and Replace is well suited to my requirements. I like how it lets me replace specific words or phrase with a new one, and does that for all

the files that I have opened. It works well with large amounts of text and I like that it can be set to replace with a phrase only

"The new version of String Find and Replace is in the works" So, a few thoughts, feedback welcome. A: I think it's a nice little tool, and I would just say a note on the "Install from command line" part. I'd say to run it like this: C:\> cmd /c "string find and replace.exe /s " "C: ewFiles*.txt" "C:\edits*.txt" That way you don't need to open cmd every time. If you want you can set it up as a shortcut and it will launch automatically when you open it. Q: Javascript, setting global variable after function I have

set a variable in my global space and I am having difficulty understanding why this works: function myFunction() { var myVar = 3; alert(myVar); } And this doesn't work: function myFunction() { var myVar; alert(myVar); } When I call myFunction from an html button event handler, I get undefined as my value. When I use the var keyword, I get a value as expected. A: When you declare a variable, you're creating a new scope. A variable in one scope cannot be visible in another. If you want to have a global variable, then create a global variable. function

myFunction() { var myVar = 3; alert(myVar); } // --- in another place --- myFunction(); alert(myVar); CFBundleDevelopmentRegion en CFBundleExecutable $(EXECUTABLE_NAME) CFBundleIdentifier $(PRODUCT_

Their number has dwindled steadily since their establishment of the Kingdom of Boralen, until now, their numbers are as small as the starving wolves they hunt with barely a bow in hand. The Empire of Falkenheim has recently sent an expedition to subjug
