Go to Add-ins -> Add-ins Search "Acme KeyGenerator" and install it. Click "New License Key" and use the key Thanks A: I know that you already have a good answer, but I found another possible method of obtaining the lic file. You can export the registration key, for instance, to a.txt file, or if you have any other way of exporting to text, as long as you have the key included in the export text. Then, you just import the text file into the software you want to use. Hope it helps! Q: How to read the same columns from multiple files I have a file with about 10 columns of floats that looks like this: 13.564 3.819 4.389 4.952 4.654 5.386 5.866 6.785 6.834... 16.589 4.356 4.902 4.915 5.024 5.871 6.176 6.914... The format is supposed to be float number, float number, float number, float number,..... and the columns have the same header name. How to read them into a single file, with columns ordered according to the header? A: So if you have 10 columns: first read the file using the following: import numpy as np #read the file with open('file.txt', 'r') as infile: reader = csv.reader(infile) line = next(reader) for i in range(10): line = next(reader) for j in range(i): print(line[j], line[j], line[j-1], line[j-1]) Now you have a list of lines, for each line you can separate by column with the following: line_arr = np.array([line]) column_arr = np.array([line]) And then you can access each column as line[i] or line[i] or line[i-1] etc. as you like. The complete file should look like this: import numpy as np
