Keyboard Macro for the Microsoft Windows operating system that triggers macros when a key or keys are pressed. KEYmacro is a powerful piece of software that will be helpful if you use it properly. The application is divided into three main sections. The first and probably the most interesting is the list of macros that can be created and saved in a database. What's more, you are also allowed to view the list of the most used macros and edit them. The list of the macros is then accessible in the application's

interface. All macros are comprised of a key, such as “A” or “B” and the sequence of commands you want executed when the key is pressed. The last part of the macro is a command that performs the rest of the steps in the program's logic, but it's not really necessary to worry about it as the application will do the rest of the work for you. There is no limit on the number of steps you can add to the macro, but it is possible to create only one macro per macro. All in all, this is a convenient way of easily creating and launching multiple programs at the same time. It's very intuitive to use and

gets the job done without any problems. KEYmacro includes:

-Macros -Keyboard macros -Database
-Export macro -Import macro -List of used macros Installation: Install
